## 29. Custom Python Interpreters¶

The modules described in this chapter allow writing interfaces similar to Python's interactive interpreter. If you want a Python interpreter that supports some special feature in addition to the Python language, you should look at the [code](#) module. (The [codeop](#) module is lower-level, used to support compiling a possibly-incomplete chunk of Python code.)

The full list of modules described in this chapter is:

### [29.1. code — Interpreter base classes](#)

- [29.1.1. Interactive Interpreter Objects](#)
- [29.1.2. Interactive Console Objects](#)
- [29.2. codeop — Compile Python code](#)

## Previous topic

[28.15. fpectl — Floating point exception control](#)

## Next topic

[29.1. code — Interpreter base classes](#)
